

A 20 W BEOL SRAM tier clears the bar under the conservative rule, not just the generous one

Llama-3.1-8B decode on a measured B200 ledger, $B=8$ $N=2048$. C2 2-layer $800 \text{ nm}^2 = 4.22 \text{ GB}$, tier duty 4.80%, burst $217 \mu\text{s}$ in a 4.515 ms step. Achievable band: 5 nm SRAM array estimate at the optimistic end, 7 nm 1 Mb macro read (periphery included) x 2 BEOL penalty at the pessimistic end. Geometry and materials: a literature-anchored design study.
