

Delivered bytes convert to time at the hardware's bandwidth -- measured, not fitted

Llama-3.1-8B, vLLM 0.10.2, RTX PRO 5000 Blackwell. Step time is extracted by differencing two generation lengths so prefill cancels; prefix caching is disabled, without which the cancellation is wrong and the slope implies 2.39 TB/s on a part that measures 1.21. The B200 coefficient 6.40 TB/s is the same quantity with that part's bandwidth substituted.
